KANTESTI V12 · AI BLOOD TEST ANALYZER

Kantesti V12 Understands HIV Test Results: Free AI Blood Test Analyzer Explains HIV Lab Reports Online, in 100+ Languages

Kantesti does not diagnose HIV. It helps people find clarity: HIV test results explained in plain language, in their own language, and the right next step with their doctor.

LONDON, 10 November 2026. Kantesti Ltd, the company behind the Kantesti AI blood test analyzer, today announced that its V12 engine reads and explains lab reports that contain HIV tests. A person uploads the report their laboratory issued online, as a PDF or a photo, and gets their HIV test results explained in plain language, in their own language: what was tested, how the laboratory reports the result, and which questions are worth taking to a clinician.

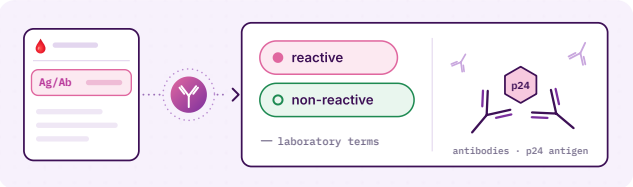

The announcement follows recent media coverage of HIV in Russia. CNN Türk reported that the outbreak there has spread to 27 regions and that cases of transmission in hospitals have reached a record level. News like this sends many people to a laboratory for the first time, and many of them then face a report full of terms they have never seen.

> "An HIV test report is one of the most stressful pieces of paper a person can hold, and nobody should have to decode it alone. We do not diagnose. We help people find their way through the report and to the right next step: their doctor."
>

> CEO, Kantesti Ltd

HIV test results explained: what Kantesti V12 covers

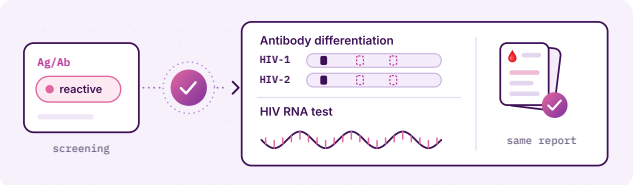

1 Screening tests

Fourth-generation antigen/antibody tests (HIV-1/2 antibodies and p24 antigen): what “reactive” and “non-reactive” mean as laboratory terms, and why a reactive screening result is not yet a diagnosis.

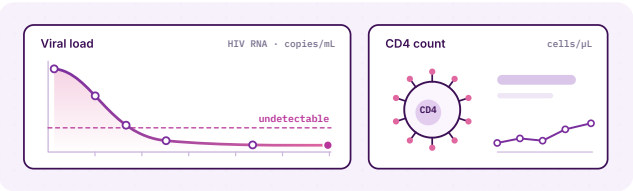

2 Confirmatory tests

Supplementary antibody differentiation and HIV RNA tests: how they relate to the screening result on the same report.

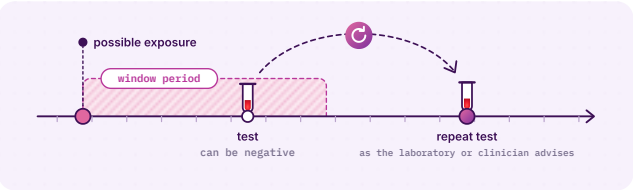

3 Monitoring tests

Viral load (HIV RNA, copies/mL) and CD4 count: what these measurements are and what “undetectable” refers to.

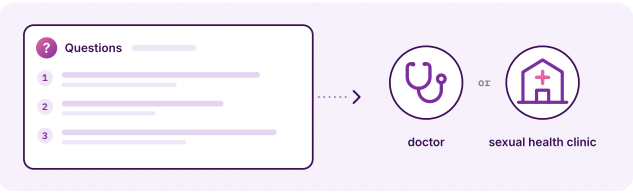

4 Timing

The window period: why a test taken very soon after a possible exposure can be negative and may need repeating, as the laboratory or clinician advises.

5 Next steps

A short list of questions to take to a doctor or sexual health clinic.

What the AI blood test analyzer does

- Explains the HIV tests a laboratory has already performed and printed on the report.
- Translates laboratory terms into everyday words, in 100+ languages, and reads the summary aloud with Kantesti Voice.
- Helps people find the right questions and the right place to take them: a doctor or a sexual health clinic.

What it does not do

- It does not diagnose, screen for or rule out HIV.
- It cannot tell from routine blood values whether a person has HIV: a blood count or biochemistry panel cannot show it. Only an HIV test can.
- It does not replace testing, counselling, a doctor’s assessment or treatment.

Why it matters to understand HIV test results

HIV today is a manageable long-term condition when it is found and treated. Public health bodies agree on two points that depend on people understanding their results: early testing leads to early treatment, and a person on effective treatment whose viral load stays undetectable does not pass the virus on through sex. A reactive screening result always needs a confirmatory test before any diagnosis is made, and a report that is understood is more likely to be followed up.

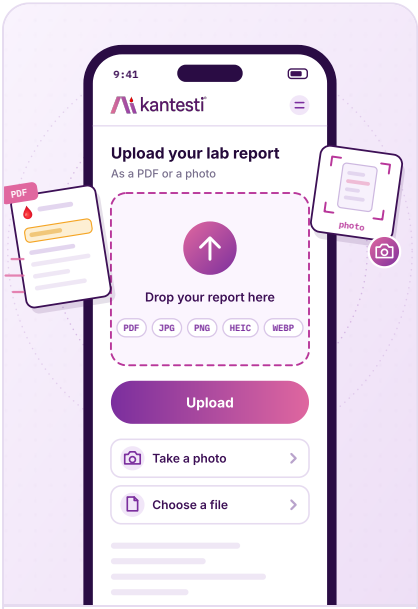

Early testing
leads to early treatment

Confirmatory test
always follows a reactive screening result, before any diagnosis

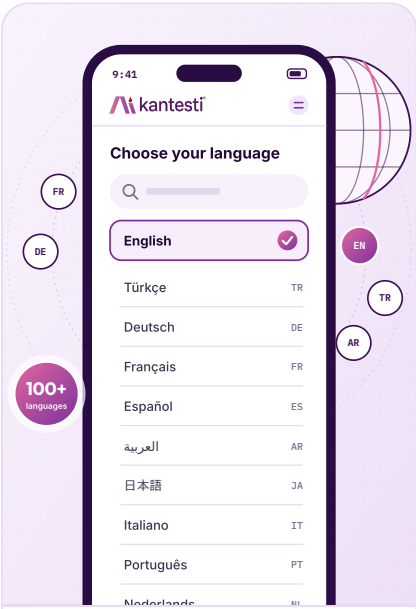

Effective treatment
a manageable long-term condition when it is found and treated

Undetectable viral load
the virus is not passed on through sex

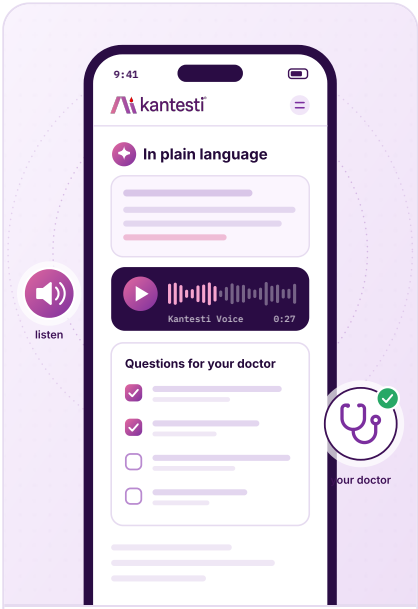

How to get a lab report explained online, free

1 Upload the lab report at www.kantesti.net or in the Kantesti app for iOS and Android.

2 Choose the language of the explanation.

3 Read or listen, then take the suggested questions to a doctor.
